Sites of disease recurrence

*Number of patients with disease recurrence regardless of pathology results of the tumour recurrence location;
†Includes CNS only (osimertinib n=4 [1%]; placebo n=26 [7%]) and CNS plus other locations (osimertinib n=1 [<1%]; placebo n=9 [3%]).
‡Includes disease recurrence in liver, renal and adrenal systems and pancreas.
One patient in the osimertinib arm and one patient in the placebo arm had CNS metastases at baseline; therefore, these two patients were censored on Day 1 and excluded from the CNS DFS efficacy analysis;

Summary

- ALINA is the first and only positive phase III trial of an ALK inhibitor in resected, stage IB–IIIA NSCLC
- Treatment with adjuvant alectinib resulted in a statistically significant and clinically meaningful improvement in DFS compared with chemotherapy (HR 0.24; 95% CI 0.13, 0.43; $p < 0.0001$)
 - The DFS benefit was seen consistently across subgroups
- An improvement in CNS-DFS was observed (HR 0.22; 95% CI 0.08, 0.58)
- Adjuvant alectinib was tolerable and in line with the known safety profile of alectinib

Adjuvant alectinib represents an important new treatment strategy for patients with resected, stage IB–IIIA, ALK+ NSCLC
